Summary of what I have learned and how it might help me find a Database Admin job

I have always believed that sequel server was just a tool like Microsoft Access where you can keep your data and retrieve it, but I was completely wrong. Now, after this taking this wonderful class with an immensely helpful professor, I have understood that SQL is an all rounded programming language with a lot of features. Now, I know what do these following SQL terms mean and I can perform functionality based on it, such as SSRS, SSIS, Maintenance Plan, logins, encryption, indexing, locking, different kinds of backups(full, differential and transaction log) and restores etc.

So, in terms of finding a database admin job, this class has helped me a lot, like teaching new skills and features in maintaining databases. I have taken few database classes before, but to be honest, this and the previous(CS3550) class was the most advanced and finest thing to have in my portfolio. Now, I can proudly say, that I have the potential and skills to become a database admin.

So, with all due respect, I am grateful to Professor Matt for this wonderful class, and I truly appreciate it.
